Managing backups for Cloud Volumes ONTAP and on-premises ONTAP systems

You can manage backups for Cloud Volumes ONTAP and on-premises ONTAP systems by changing the backup schedule, enabling/disabling volume backups, creating an on-demand backup, deleting backups, and more.

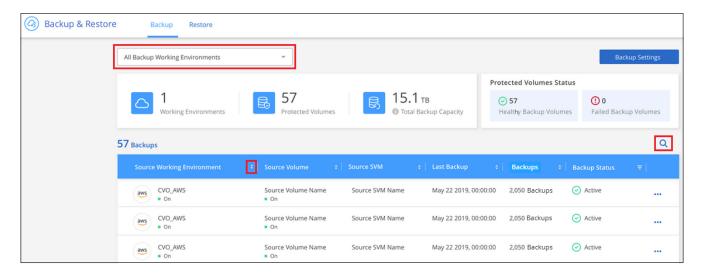

Do not manage or change backup files directly from your cloud provider environment. This may corrupt the files and will result in an unsupported configuration.

Viewing the volumes that are being backed up

You can view a list of all the volumes that are currently being backed up in the Backup Dashboard.

Steps

- 1. Click the Backup & Restore tab.
- 2. Click the **Backup** tab and the Backup Dashboard is displayed.

If you are looking for specific volumes in certain working environments, you can refine the list by working environment and volume, or you can use the search filter.

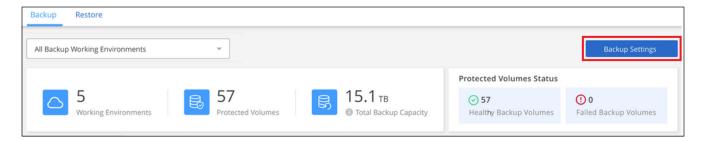

Changing the schedule and backup retention

The default policy backs up volumes every day and retains the most recent 30 backup copies of each volume. You can change to a combination of hourly, daily, weekly, or monthly backups and you can change the number of backup copies to retain. You can also select one of the system-defined policies that provide scheduled backups for 3 months, 1 year, and 7 years.

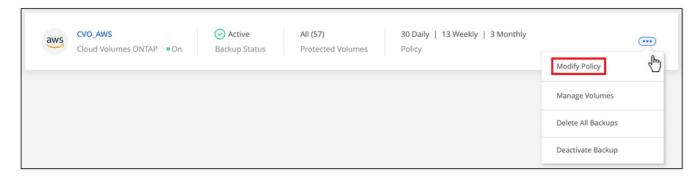

Changing the backup policy affects both new volumes created after you change the schedule, and any existing volumes that were using the original policy.

Steps

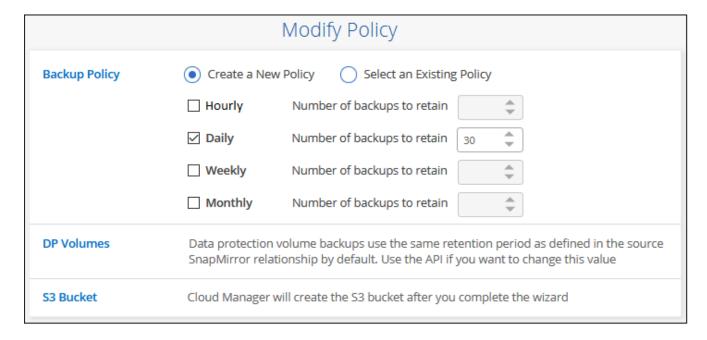

1. From the Backup Dashboard, select **Backup Settings**.

2. From the *Backup Settings page*, click ••• for the working environment where you want to change the settings and select **Modify Policy**.

3. From the Modify Policy page, change the schedule and backup retention and then click Save.

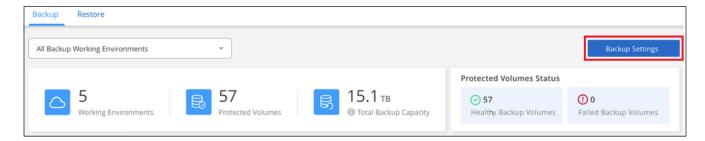

Starting and stopping backups of volumes

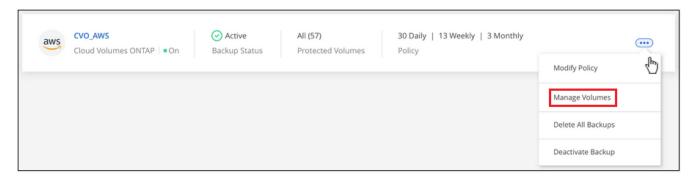

You can stop backing up a volume if you do not need backup copies of that volume and you do not want to pay for the cost to store the backups. You can also add a new volume to the backup list if it is not currently being backed up.

Steps

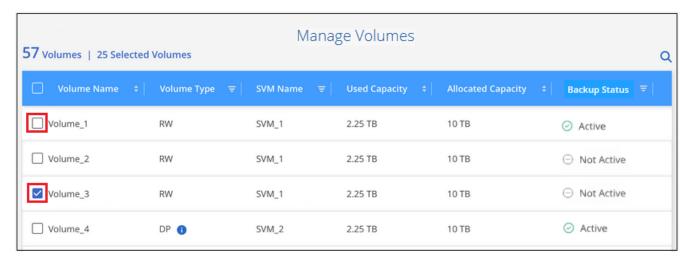

1. From the Backup Dashboard, select **Backup Settings**.

2. From the Backup Settings page, click ••• for the working environment and select Manage Volumes.

3. Select the checkbox for volumes that you want to start backing up, and deselect the checkbox for volumes that you want to stop backing up.

4. Click Save to commit your changes.

Note: When stopping a volume from being backed up you'll continue to be charged by your cloud provider for object storage costs for the capacity that the backups use unless you delete the backups.

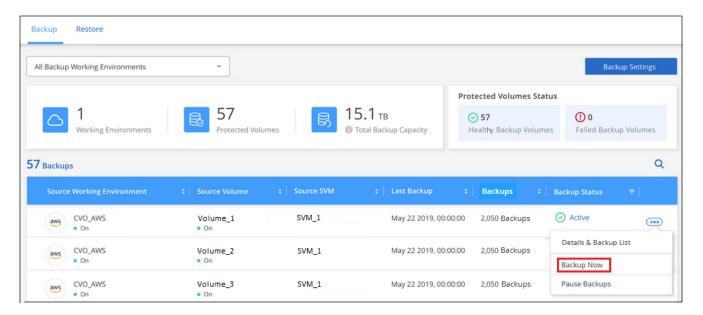

Creating a manual volume backup at any time

You can create an on-demand backup at any time to capture the current state of the volume. This can be useful if very important changes have been made to a volume and you don't want to wait for the next scheduled backup to protect that data, or if the volume is not currently being backed up and you want to capture its current state.

The backup name includes the timestamp so you can identify your on-demand backup from other scheduled backups.

Steps

1. From the Backup Dashboard, click ••• for the volume and select **Backup Now**.

The Backup Status column for that volume displays "In Progress" until the backup is created.

Viewing the list of backups for each volume

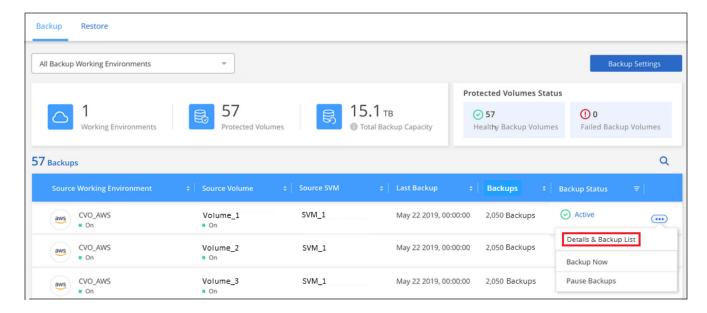

You can view the list of all backup files that exist for each volume. This page displays details about the source volume, destination location, and backup details such as last backup taken, the current backup policy, and more.

This page also enables you perform the following tasks:

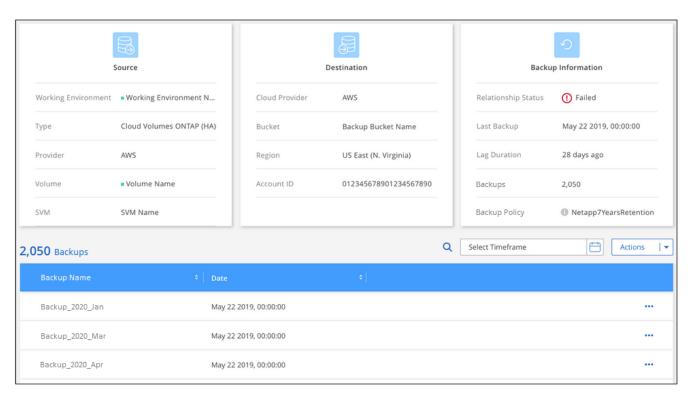

- · Delete all backup files for the volume
- · Delete individual backup files for the volume
- · Download a backup report for the volume

Steps

1. From the Backup Dashboard, click ••• for the source volume and select **Details & Backup List**.

The list of all backup files is displayed along with details about the source volume, destination location, and backup details.

Deleting backups

Cloud Backup enables you to delete a single backup file, delete all backups for a volume, or delete all backups of all volumes in a working environment. You might want to delete all backups if you no longer need the backups or if you deleted the source volume and want to remove all backups.

Note that deleting all backups does not disable further backups of this volume or the working environment. If you want to stop creating backups of a volume, you can disable backups as described here. If you want to stop creating backups of all volumes in a working environment, you can deactivate backups as described here.

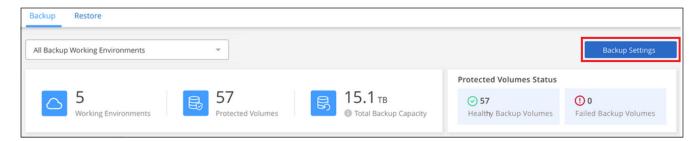

If you plan to delete a Cloud Volumes ONTAP or on-premises ONTAP system that has backups, you must delete the backups **before** deleting the system. Cloud Backup doesn't automatically delete backups when you delete a system, and there is no current support in the UI to delete the backups after the system has been deleted. You'll continue to be charged for object storage costs for any remaining backups.

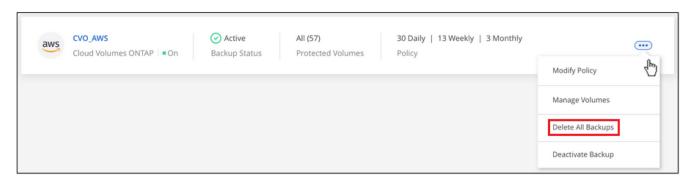

Deleting all backup files for a working environment

Steps

1. From the Backup Dashboard, select Backup Settings.

2. Click ••• for the working environment where you want to delete all backups and select **Delete All Backups**.

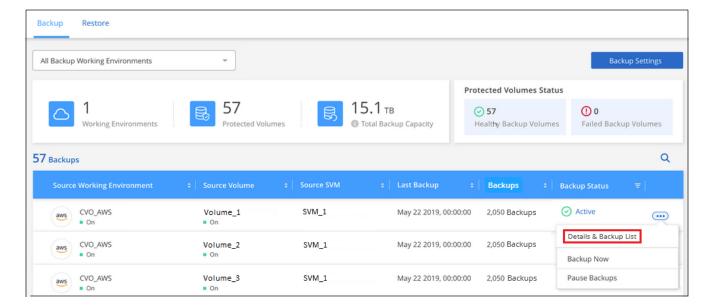

3. In the confirmation dialog box, click **Delete**.

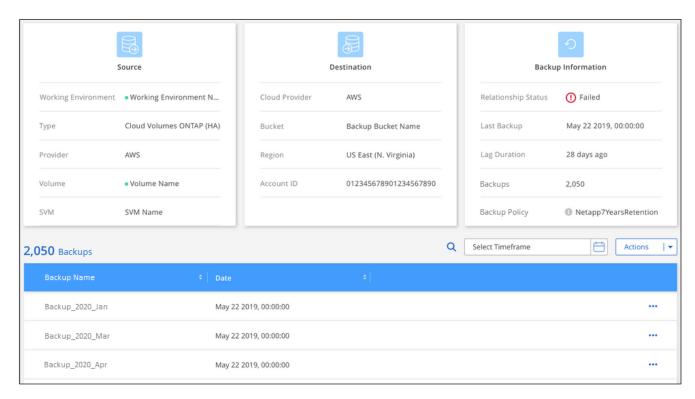

Deleting all backup files for a volume

Steps

1. From the Backup Dashboard, click ••• for the source volume and select **Details & Backup List**.

The list of all backup files is displayed.

2. Click Actions > Delete all Backups.

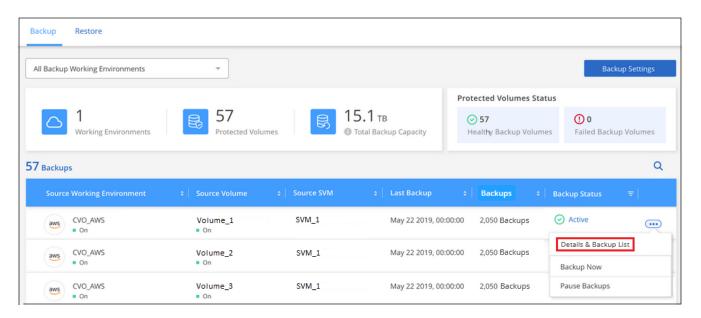

3. In the confirmation dialog box, enter the volume name and click **Delete**.

Deleting a single backup file for a volume

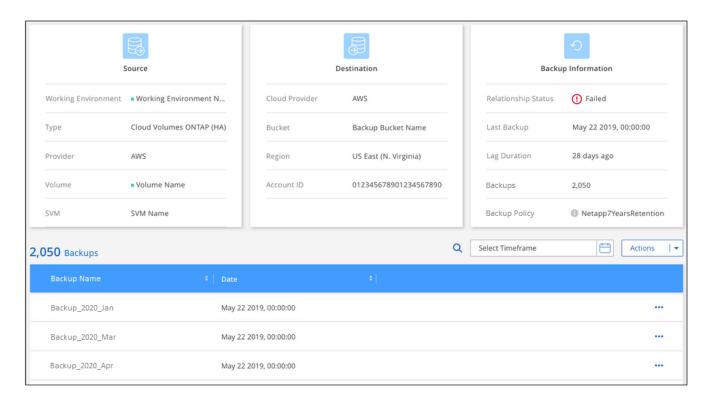

You can delete a single backup file. This feature is available only if the volume backup was created from a system with ONTAP 9.8 or greater.

Steps

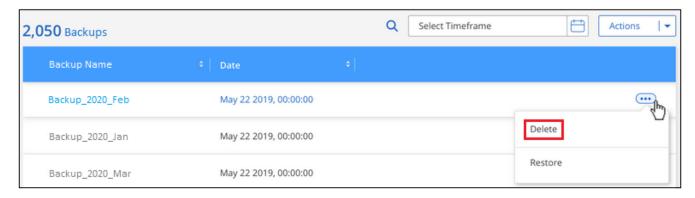

1. From the Backup Dashboard, click ••• for the source volume and select Details & Backup List.

The list of all backup files is displayed.

2. Click ••• for the volume backup file you want to delete and click **Delete**.

3. In the confirmation dialog box, click **Delete**.

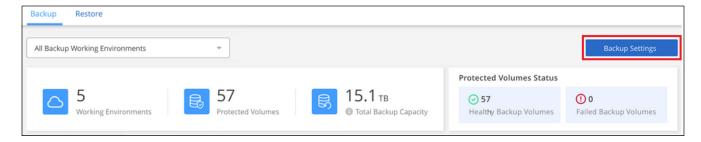

Disabling Cloud Backup for a working environment

Disabling Cloud Backup for a working environment disables backups of each volume on the system, and it also disables the ability to restore a volume. Any existing backups will not be deleted.

Note that you'll continue to be charged by your cloud provider for object storage costs for the capacity that your backups use unless you delete the backups.

Steps

1. From the Backup Dashboard, select Backup Settings.

2. From the *Backup Settings page*, click ••• for the working environment where you want to disable backups and select **Deactivate Backup**.

3. In the confirmation dialog box, click Deactivate.

The "Deactivate Backup" button changes to "Activate Backup" while backup is disabled on that working environment. You can click **Activate Backup** if you want to enable all backup functionality for that working environment.
